What we discussed in sprint 1:

1. The meaning of this class, which is developing software based on the clients' requirement. We will learn how to manage and design the project by ourselves. We should often contact with the clients to make sure that we are on the right track.
2. About sprint: We will make a plan for every step of the project and each of us will be responsible for some parts of the project. We will discuss what we did before the sprint and what problem we encountered. We will also make a plan for next sprint.
3. Confluence: This can be our wiki for our project. We can record what we did here. This is optional.
4. Jira: This is a place for us to show what everyone did in the previous sprint. We will describe what we did. Everyone can create a task and assign it to himself. The sprint leader will be responsible for making sure that everyone finished the assigned task before the sprint.
5. Contact with our clients: We can contact with our clients and discuss what we should do or what we shouldn't do.
6. Try to plan for the next sprint: After this sprint, we should make a plan for next meeting.
7. What is the final type of our final project? -> We should discuss with the clients.
8. How we connect with each other (for our team). We use a mobile-based app to connect with each other.
